

The Pond and Creek

What types of fish and other animals are found in this habitat?

- Bullfrogs
- Duck
- Turtle
- Sunfish
- Garter Snake
- Dragonflies and other bugs

What important roles do these creatures play in a pond ecosystem?

- The turtle's role in the pond is that if the turtle didn't live in the pond then the whole food chain would change. Instead of the raccoon eating a turtle the raccoon might have to eat the ducks instead. Also, the raccoon might not have what it needs to survive if the turtle was not a role in the pond.

Why are ponds important to the environment?

- Ponds are important to the environment because animals drink out of a pond and if the world had no ponds then the animals would die because of lack of water. Also, we wouldn't be able to eat any of the animals from the pond such as a duck because they would be dead from lack of water.
